Abstract

Woke technology in relation with Artificial Intelligence (AI) has become an evolving phenomenon in diverse area of study in recent times most especially in Humanities, business, automotive, technology, medicine, and education. However, AI has made its way deeper into Literature in the last few years, helping writers and authors create content, develop stories and helping to publish them online. In addition, in areas of Arts, Public Relation and Marketing, instruments previously limited to companies at the enterprise level have become inexpensive and open to medium and small businesses. Using Actor-Network Theory, the study is set to critique how widely AI is implemented in Literature, and other field of study. Part of the submission or conclusion is that AI helps in all aspects, especially in Literature, Mass communication and Public Relation.

Keywords: Artificial Intelligent (AI), Studies in Humanities, Unlocking Benefits,

Word Count: 130

Introduction

The Humanities, traditionally seen as the domain of human insight and interpretation, are on the cusp of a revolution. Artificial intelligence (AI) is transforming the way we study and understand human culture, history, and expression. By harnessing the power of machine learning, natural language processing, and data analytics, AI can unlock new perspectives, reveal hidden patterns, and enhance research methodologies in fields such as literature, history, philosophy, and cultural studies. As AI technologies continue to evolve, they offer unprecedented opportunities for Humanities scholars to reexamine familiar texts, challenge established narratives, and explore uncharted territories of human knowledge. In this context, 'Unlocking the benefits of artificial intelligence for Studies in Humanities' becomes a pressing imperative, one that promises to redefine the boundaries of humanistic inquiry and open up new avenues for collaboration, creativity, and critical thinking.

Background

The Humanities have long been characterized by their emphasis on human interpretation, critical thinking, and nuanced understanding. However, the sheer volume and complexity of data in the digital age have created new challenges and opportunities for humanistic inquiry. Artificial intelligence (AI) has emerged as a transformative force, capable of analyzing vast amounts of data, identifying patterns, and generating insights that can augment human capabilities. In recent years, AI has made significant inroads in various fields, including science, technology, engineering, and mathematics (STEM). Nevertheless, its application in the

Humanities has been relatively limited, despite the vast potential for AI to enhance research, teaching, and learning in Arts and Humanities.

Traditional Humanities Research Methods, which often time is reliant on manual analysis and interpretation, can be time-consuming and labour-intensive. The advent of AI offers a chance to overcome these limitations, enabling researchers to process and analyze large datasets, identify subtle patterns and connections, generate new research questions and hypotheses, enhance collaboration and knowledge sharing among other numerous benefits.

Moreover, AI can facilitate innovative pedagogies, such as personalized learning, adaptive assessments, and interactive visualizations, which can enrich student engagement and understanding. However, the integration of AI in Humanities also raises important questions about the role of human judgment, the potential for bias in AI systems, and the need for interdisciplinary collaboration. As AI technologies continue to evolve, it is essential to explore their implications for Humanities research and pedagogy, ensuring that we harness their potential while remaining mindful of their limitations.

Theoretical Framework

The study adopts Humanities-AI Nexus theory. This component explores the intersections and interactions between Humanities research and AI technologies, highlighting the potential for mutual enhancement. The theory enhances Traditional Humanities Research Methods, enabling new insights and perspectives. It also ensures that AI systems are sensitive to human values, ethics, and context. The collaboration between Humanities and AI researchers generates new knowledge, methodologies, and research questions which afford Humanities scholars develop critical awareness of AI's potential and limitations, promoting informed engagement with AI systems.

Objectives

The paper explores the usefulness of AI for an improved study in humanity. It also harnesses and embraces the development and incorporation of AI into study in Humanity.

Discussion

Artificial intelligence (AI) has become an increasingly popular topic among literary scholars, as it has the potential to automate many of the time-consuming and repetitive tasks. The use of AI in literature has been a topic of discussion for several years, with many experts predicting that it will significantly reshape literature, reading and scholarly writing. As such, it is essential to understand how literature blends with AI and how this technology is impacting on the study of literature.

AI Tools for Education

With history dating back to the mid-twentieth (20th) century, the Digital Age describes an epoch characterised by the rapid transformation from the Industrial Age to the era of Information Technology Andersson, (2018). This marked the use of electronic means of communication; facilitated by computer technology (The Internet of Things) which is also referred to as “The New Media”, Igben & Ilaya, (2021). Amongst the numerous uses of this technology is that it provides instantaneous access to information regardless of place and time.

Despite the growing interest in the application of artificial intelligence (AI) in the field of literature, there is a limited understanding of the extent to which literature and the study of literature is exploiting and appreciating AI in their daily operations Wang, (2020). Moreover, the implementation of AI in literature may have significant implications for the quality of services provided by literary scholars, in the nature of work carried out by professionals in the field, and the overall competitiveness of the literary industry. Xie et al., (2020).

Therefore, part of the objective of the study is to investigate the extent at which woke technologies imparted AI in the study of literature and to examine the benefits and challenges associated with the use of AI in the study of literature. The convergence of the digital age and literature is accentuated by the integration of Artificial Intelligence (AI) technologies, marking a significant point of synchronization Galloway & Swiatek, (2018). AI refers to the simulation of

human intelligence in machines, enabling them to perform tasks that traditionally required human cognition Thiraviyam, (2018). In the realm of literature, AI has emerged as a powerful tool that automates routine tasks, enhances decision-making, and offers data-driven insights for communication strategies.

Ngondo (2019) and Sommerfeldt and Yang (2018) emphasize the transformative potential of AI in the roles of literary practitioners. Literature either oral or written stems from being traditionally and pedagogically executed, but now, the role expands to involve gathering insights from AI tools and applications. AI is the embedding of technologies that enable machines to perform tasks such as moving data, analyzing data, and processing data, while being better than humans.

Rather than creating jobs or employing writers, language teachers, language interpreters, content writers, script writers and developers, editors, and other works related to language, literature and writing ; AI and machine learning can help skilled workers do a better writing and secretarial job, complementing human and jettisoning the need for man power. Language and Literature could be taught through Apps, and literary contents or information could be shared or transmitted through social media platforms like Twitter, Facebook, Instagram, LinkedIn etc, which is good news. AI allows for accurately quantifying people's feelings and opinions about a brand and compares those feelings with real-time data from social media platforms.

Dignum, (2018) stated that AI can carry out typically human intelligence tasks. In the AI age, people will discover and rediscover themselves as training to meet up with the trend will be intensified.

AI technologies in the field of literature can generate many economic fields Ardila, (2020). Many of these tools currently feature AI algorithms that extract qualitative and quantitative data about individuals' behaviors, feelings, and opinions. An explanation is sentiment analysis which uses AI to decide whether or not some writing is positive, negative, or neutral. AI has had a bit of a slow beginning within the communications profession. Professionals in the field of literature are growing fast to catch up with AI, adopt and adapt to AI new technologies. Literary agencies have begun harnessing AI's ability in their daily functions and understanding its potential to streamline consumer operations, create new experiences that increase brand affinity, and improve user experiences.

AI can automate and accomplish multiple tasks within the literary framework especially in reviewing literature. These tasks encompass data-based story writing, media lists organisation and updating, crisis management assistance, audio transcription and conversion to text, media trends and prediction, social media monitoring, and management. Data Mining (DM) is the job of obtaining useful information needed and desired from large databases.

As AI takes a prominent place in literary practices, the roles of literary professionals is fast becoming antiquated and old-fashion. These professionals are no longer solely information disseminators but are also strategists who harness AI-generated insights to shape effective communication plans. AI complements human capabilities, resulting in a dynamic synergy that augments decision-making Galloway & Swiatek, (2018).

Today, developing technologies that increase memory capacities and storage capacities have facilitated the work of data mining. Data mining is a technique developed as an extension of AI, and today we see that data mining is used in many fields, in many disciplines, as a technique used as an extension of AI. Data mining is defined as “the process of revealing valuable information that is waiting to be discovered in large data piles, that we cannot reveal with fore-sense and predictions, and that will provide great benefit to the unit in need if it is discovered” Silahtaroglu, (2016).

Data mining is a process that uses statistical, mathematical, artificial intelligence and machine learning techniques to extract meaningful relationships between the data in the database, to distinguish, identify, reveal and obtain usefully, sought and useful data from large databases. Data mining applications are becoming increasingly popular for various applications in various sectors.

AI serves as an invaluable ally to literary professionals by augmenting their decision-making processes. The flood of data generated in the digital age can overwhelm traditional methods of analysis. Here, AI's ability to process vast amounts of data and extract actionable insights becomes indispensable. Literary professionals can now make informed decisions based on AI-generated patterns, sentiments, and trends. This augmentation enhances the precision of communication strategies, enabling professionals to tailor messages to resonate more effectively with target audiences Aytac & Bilge (2013).

Borkar, S., & Rajeswari, K. (2013) mentioned that Data mining is the process of analysing data from different perspectives and summarising it into important information to identify hidden patterns from a large data set “Data Mining is divided into methods according to the subject and the type of data. Classification, clustering and association rules are the main methods” Karagöz, (2007).

One of the most used rule-based machine learning methods is association rules learning, designed to find meaningful relationships between variables in large databases using metrics and other measurable tools. The incorporation of AI empowers literary professionals to delve into the realm of predictive analysis. By analysing historical data and recognising patterns, AI tools can forecast potential outcomes of different communication strategies. This futuristic insight guides literary professionals in crafting proactive strategies that anticipate audience reactions and address emerging trends. As a result, strategies become more adaptive and proactive, enabling professionals to stay ahead of the curve and respond effectively to shifts in public sentiment Thiraviyam, (2018).

One of the remarkable capabilities of AI lies in its capacity for personalisation. Literary professionals can leverage AI-driven algorithms to analyse individual preferences, behaviors, and online interactions. This knowledge allows for the creation of hyper-targeted campaigns that resonate deeply with specific audience segments. AI-driven chatbots, for instance, can engage with individuals in real-time, providing personalised responses and information. This heightened level of engagement enhances brand loyalty and strengthens relationships between organisations and their stakeholders Sommerfeldt & Yang, (2018).

Routine and time-consuming tasks, which were previously handled manually, can now be automated through AI. For literary professionals, this translates into more efficient workflow management. AI-powered tools can create and schedule content, monitor media coverage, and analyse campaign performance, all in a fraction of the time it would take to execute these tasks manually. This newfound efficiency liberates literary professionals from mundane tasks, enabling them to focus on strategic thinking and creative ideation Valin, (2018).

The awareness level of artificial intelligence (AI) among Media Relations Managers and Directors plays a pivotal role in shaping the communication strategies and tactics of organisations in today's rapidly evolving digital landscape. AI technologies have increasingly become integral tools for businesses and corporate bodies to analyse data, automate tasks, personalise content, and optimise engagement with their target audiences Johnson, (2021). However, the extent to which Media Relations Managers and Directors are aware of AI's capabilities and implications can significantly impact their ability to harness its potential for effective media relations.

It is essential to recognise that AI-driven tools have the potential to revolutionise media relations by automating routine tasks such as media monitoring, sentiment analysis, and content generation. Media Relations Managers and Directors who are well-versed in AI are more likely to leverage these tools to enhance their efficiency and accuracy, allowing them to stay ahead of breaking news and emerging trends. AI also assists in identifying relevant journalists, influencers, and media outlets, thereby improving the targeting of media outreach efforts. Understanding AI's role in data analytics is crucial for media professionals Valin, (2018). AI-powered analytical tools can process vast amounts of data to uncover actionable insights about audience behaviour and media coverage. Media Relations Managers and Directors with awareness of these capabilities can fine-tune their messaging strategies, measure campaign effectiveness, and make data-driven decisions to optimise their media relations efforts.

The integration of AI in content creation and personalisation is transforming the way organisations communicate with their audiences. AI helps to tailor content to individual preferences and behaviours, increasing engagement and relevance. Those in media relations who comprehend AI-driven content generation and personalisation are better positioned to craft compelling narratives that resonate with their target audiences Galloway & Swiatek, (2018).

Media Relations Managers and Directors should be aware of AI's impact on the media landscape itself. AI is influencing literature and journalism through automated news generation and content creation, which can have both positive and negative effects on media relations. Understanding these shifts can help media professionals adapt their strategies and foster better relationships with journalists, grammarians, literary scholars and media outlets.

The ethical considerations surrounding AI, such as bias in algorithms and data privacy, are increasingly important in media relations. Media professionals need to be aware of these issues to navigate potential pitfalls and ensure that their strategies align with ethical standards and legal regulations Amodu et al., (2019). Proactive awareness can help prevent reputational damage and legal liabilities.

Literature is a discipline, a field of practice required by every institution or organisation that should communicate. Literature is a discipline with its rules and gains vitality through communication. In fact, every new communication tool and method has become a literary tool. The method from the first applications to the present is the most important basis of the relationship between communication and literature. Today, communication that has been moved to the digital environment has affected literary practices, and social media has turned into a literary tool and method as soon as possible. Peltekoğlu, (2012).

Practically speaking, literature is a 'relationship' business built around creativity, networking, and the ability to communicate effectively through compelling content. Factors like accelerated business and digitisation of the media have changed literature from a business relationship to a terabyte business" Ibrahimzade, (2017).

Technological improvement is what has made literary initiatives become regular. Understanding and discussing AI and machine learning (AI & ML) are critical in this study. AI is concerned with creating computers capable of learning, reasoning, and self-correction like humans. The idea is that machines can develop some of the same skills as humans, such as learning, adapting, and self-correcting. Human intelligence is being expanded through the use of computers, just as physical power has been expanded through the use of mechanical tools in the past. In a limited sense, the study of methods for more successfully using computers through enhanced programming approaches.

Rather than looking at a broad definition of AI, one can focus on the notion of artificially intelligent systems. There are numerous definitions available, but most of them may be divided into four groups: systems that think like people, systems that act like humans, systems that think logically, and systems that act rationally. In the communications industry, AI has gradually gained traction. In the field of literature, AI can frame data-driven content and manage crises. It is also aware of forthcoming media trends. Only the most well-known literary firms have been able to use AI in their regular operations so far. It is being used to improve people's talents. As a result, literary professionals can devote more time to creative endeavors. The level of diversity in literary roles may be reduced due to AI ignorance. As a result, the function of such technology has become critical in ensuring the improvement and total integration of literature in AI campaigns.

AI machine inputs are beneficial for both qualitative and quantitative judgments. It aids in determining the campaign's timing, substance, media, and target audience. Literary professionals can use AI to create hyper-specific communications best suited to their client's or audience needs. It can reduce the effort spent creating material for a certain audience. AI has attempted to relieve literary experts of tedious work. With the help of AI, routine or repetitive tasks can be completed quickly. Robotic Process Automation (RPA) makes various routine tasks possible thanks to this technology. The firm's machine schedules calendars, structure meeting notes, and perform other related tasks. Technology is freeing literary professionals from tasks such as referencing most especially with the use of Mendeley referencing Apps, administration, number crunching, and file organisation. They can use technology to generate, organise, and prioritise tasks in their businesses to fulfill the needs of their clientele.

Automation and machine learning assist experts in determining which components contribute to the success of literary initiatives because a machine can perform tasks faster than a human. It is simple to make quick and precise conclusions that benefit the client. It aids in understanding and predicting trends, which is necessary for decision making. AI and machine learning are used to power a variety of analytical and creative tools that can be used to form literary contents. Literary professionals are enabled from the new relationship between humans and those new intelligent machines to create data-driven campaigns, automate repetitions, analyse online conversations, and predict crises.

The integration of AI necessitates a paradigm shift in the skill set of literary professionals. While AI automates several aspects of literature, human oversight remains essential for strategic direction and critical thinking. Literary professionals are compelled to up-skill, acquiring proficiency in understanding and managing AI tools. This not only ensures the effective integration of AI into literary strategies but also fosters continuous learning and adaptability, preparing professionals for the evolving landscape of communication Galloway & Swiatek, (2018).

As AI's role in literature expands, challenges emerge alongside the benefits. Literary professionals must navigate ethical considerations such as data privacy, bias mitigation, and the potential for AI-generated misinformation. Maintaining transparency in AI-driven communication becomes paramount to build and preserve trust with audiences. Professionals must also grapple with the delicate balance between human judgement and AI assistance, ensuring that technology remains a tool rather than a replacement for human expertise Amodu et al., (2019).

The integration of AI has propelled professionals in literature into a new frontier of excellence, characterised by data-driven decision-making, enhanced personalisation, and strategic foresight. The symbiotic relationship between AI and literary professionals empowers organisations to navigate the complexities of the digital age while maintaining the human touch that underpins effective communication. As AI continues to evolve, professionals in literature stand at the forefront of embracing its potential, leveraging it as a catalyst for innovative and impactful communication strategies. In this dynamic landscape, the synergy between human ingenuity and technological prowess paves the way for a future where literary professionals are poised to shape communication narratives that resonate with authenticity and resonance.

The rapid advancement of technology, particularly the integration of Artificial Intelligence (AI), has led to a transformative shift in various industries, redefining traditional paradigms and shaping new horizons. In this context, the field of literature stands as a testament to the profound impact that technology can wield on communication practices, reputation management, and stakeholder engagement.

The journey from the Industrial Age to the Information Technology era, as illuminated by scholars like Andersson (2018), signifies a monumental transition that has given rise to what is now commonly referred to as the era of "New Media." This era is characterised by electronic communication facilitated by computer technology, exemplified by the advent of the Internet of Things (IoT) and the rapid proliferation of digital platforms Igben & Ilaya, (2021). This

transformation has been accompanied by a seismic shift in the way information is accessed, disseminated, and consumed, reshaping communication dynamics across industries.

At the heart of this transformation lies the practice of language and literature, a field that has historically been entrusted with the responsibility of managing the linguistic, communication and creative reputation, fostering positive relationships, and strategically disseminating information. Scholars such as David and Krishnamurthy (2017) underscore the centrality of nation building in the country's literature, maintaining, and restoring reputation through multifaceted activities that range from issue management to crisis communication. As organisations navigate the complexities of the modern digital landscape, literary professionals have increasingly turned to technology as an ally in their quest to effectively communicate with diverse audiences.

The integration of AI within the realm of literature represents a pivotal point of convergence between the digital age and communication practices. AI, as defined by Thiraviyam (2018), encompasses technologies that simulate human intelligence, enabling machines to perform tasks traditionally requiring human cognitive abilities. This inclusion of AI in literary processes has ushered in a new chapter in the industry's evolution, introducing efficiencies, insights, and capabilities previously unattainable. Scholars like Galloway and Swiatek (2018) have highlighted the potential of AI to revolutionise literature by automating tasks, enhancing decision-making, and generating data-driven insights that inform communication strategies. However, as Amodu et al. (2019) suggest, the adoption of AI in literature is not without its complexities and challenges. Concerns regarding ethical implications, the potential for AI-generated misinformation, and the need for up-skilling and upgrading literary professionals to navigate the new landscape have all emerged as critical considerations.

Artificial Intelligence (AI) brings a multitude of benefits to the field of Literature in our digital world. AI empowers literary professionals with unparalleled data analytics capabilities. AI tools can process vast amounts of data from various sources, providing insights into public sentiment, emerging trends, and critical issues. This data-driven approach allows scholars in the field of literature to make informed decisions, craft targeted strategies, and assess the impact of their campaigns in real-time. In a digital world where information spreads quickly, data analytics powered by AI is invaluable.

AI technologies have revolutionised the way literary professionals analyse data, engage with audiences, and strategise their communication efforts. Global counterparts can now harness AI-powered tools to process vast amounts of data from various sources, including social media, news articles, and blogs. These tools can perform sentiment analysis, track trends, and identify emerging issues, providing literary professionals with invaluable insights into public opinion.

In Nigeria, social media has been able to assist practitioners in their daily dealings in the constant engagement of a company's target audience on daily basis through feedback Ogbette et al., (2019). Apuke and Tunca, (2018) detected that feedbacks could be in the form of 'likes' and 'dislikes' on applications such as Facebook and Instagram with 'hash tags' on Twitter and 'comments' on YouTube. These are avenues through which literary professionals can interact with the end users of their products. One advantage of this is that it changes the one sided

ideology around literature done in a traditional pen and paper fomular through a more engaging and interactive two-sided bilateral approach Ngondo, 2019, Sommerfeldt & Yang, (2018). Imperatively, prior to the advent of the new media, the impact of literary activities was not easily measured. However, social media has made quantification of investments made in the field of literature measurable through several metrics available on the platform Bakir et al., (2019).

AI Tools in Humanities

Grammarly

Grammarly is an AI powered writing assistant that helps students improve their writing skills. It can detect and correct grammar, spelling, punctuation, and style mistakes in real time. This tool is especially useful for students when writing essays, term papers, and other academic assignments.

Notion

Notion is an all-in-one workspace that allows students to organize and manage their tasks, notes, and projects. It combines the features of note-taking, task management, and project planning into a single platform.

Synteia

Synteia is a cutting-edge AI powered tool developed by IU International University of Applied Sciences, specifically for our students. It's available in English in all of our courses, and it's a groundbreaking development in online education.

Gradescope

Gradescope is an AI powered grading tool that streamlines the grading process for students and instructors. It allows students to submit their assignments online and automatically grades multiple-choice, fill-in-the-blank, and coding questions.

Chat-GPT

Chat-GPT needs no introduction (but we'll do it anyway). This game-changing web application is not only one of the best AI tools for students - it's one of the best AI tools for everyone.

Tutor.ai

Tutor.ai is an AI based tutoring platform that connects students with qualified tutors. Through the platform, students can schedule virtual tutoring sessions, receive personalized assistance, and get help with difficult subjects or assignments.

Copyscape

Copyscape is an AI powered plagiarism detection tool that helps students ensure their work is original and properly sourced. It scans documents for duplicate content and provides a report showing any matches found on the web.

Otter.ai

This handy transcription tool converts spoken language into written text. It is particularly helpful for students who want to transcribe lectures, interviews, or class discussions.

DALL-E

This tool isn't meant for every student - though we certainly recommend it - but it is without a doubt one of the best AI tools for students of graphic design or the visual arts.

Mendeley

Mendeley is a reference management tool that helps students organize and annotate their research papers and articles.

Conclusion

In a way of AI becoming beneficial to humanities, AI has had a profound impact on media monitoring and coverage analysis. These tools can identify relevant news articles and social media posts, helping literary professionals make some scholarly judgements and critiques responding promptly to emerging issues. This capability is especially crucial in a dynamic media landscape where news spreads rapidly and very fast through diverse social media channels and outlets.
